SAFETY INSTRUCTIONS

SAFETY PRECAUTIONS

1. Comply with all caution and safety-related notes provided on the side of the cabinet, inside the cabinet, and on the chassis,
2. When replacing a chassis in the cabinet, always be certain that all the protective devices are installed properly, such as control knobs, adjustment covers, shields and barriers.
3. Before replacing the back cover of the set, thoroughly inspect the inside of the cabinet to see that no stray parts or tools have been left inside.

ANTENNA COLD CHECK

Remove AC plug from the 120 VAC outlet and place a jumper across the two blades. Connect one lead of an ohmmeter to the jumpered AC plug, and touch the other lead to each exposed antenna terminal (UHF and VHF antenna terminals). The resistance must measure between 1M ohm and 5.2M ohm. Any resistance value below or above this range indicates an abnormality which requires corrective action.

LEAKAGE CURRENT CHECK

Plug the AC line cord directly into a 120 VAC outlet. (Do not use an isolation transformer for this check.) Use an AC voltmeter, that has 5000 ohms per volt or more sensitivity. Connect a 1500 ohm 10 watt resistor, paralleled by a 0.15 μ F 150 VAC capacitor, between a known good earth ground (water pipe, conduit, etc.) and all exposed metal parts of the cabinet (antennas, handle bracket, metal cabinet, screw heads, metal overlays, control shafts, etc.). Measure the AC voltage across the 1500 ohm resistor. The AC voltage should not exceed 750 mV. A reading exceeding 750 mV indicates that a dangerous potential exists. The fault must be located and corrected. Repeat the above test with the receiver power plug reversed.

NEVER RETURN A RECEIVER TO THE CUSTOMER WITHOUT TAKING THE NECESSARY CORRECTIVE ACTION.

PRODUCT SAFETY NOTICE

When replacing components in a receiver, always keep in mind the necessary product safety precautions. Pay special attention to the replacement of components marked with a star (★) in the parts list and in the schematic diagrams. To ensure safe product operation, it is necessary to replace those components with the exact same PARTS.

SERVICE ADJUSTMENTS

GENERAL

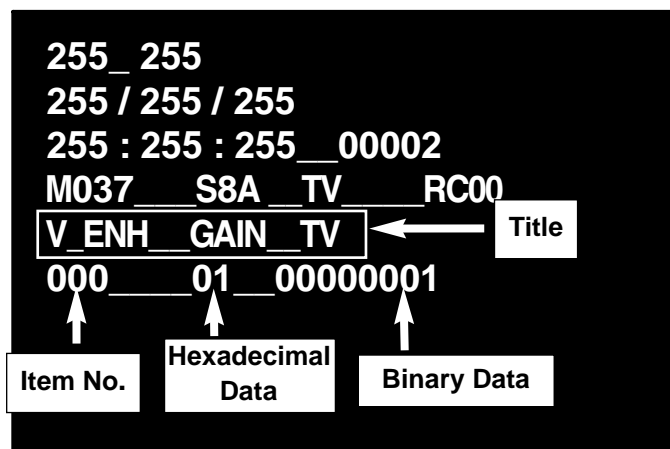

This set has an On-screen Service Menu system included in the CPU that allows remote operation for most of the service adjustments.

ON-SCREEN SERVICE MENU SYSTEM

1. Enter the Service Menu:

- While pressing the Volume (-) button on the television, press the Number Key 1 on the remote control unit. The Service Menu will now appear.

Service Menu Display

2. Service Adjustments:

- Press the ▲ or ▼ key to select the desired service menu item you want to adjust. See page 4 for the On-screen Service Menu.

Note: Press the Mute key to skip up 16 items.

- Use the + or - key or number keys to adjust the data. The + or - keys will increase or decrease the data sequentially. The number keys (0 ~ 7) toggle only their respective bits between 1 and 0 and are used to change the Sub-Address. For example to change bit 5 press the number 5 key. See below.

Note: Using the + or - is not recommended due to possible rapid changes.

3. Exit from the Service Menu:

- Press the MENU key to turn off the Service Menu display.

POWER FAILURE CIRCUIT

CPU (IC801) is programmed so the set will go to the standby mode when there is circuit failure as described below. (Refer to "Block Diagram Power Lines" and "Block Diagram Power Board").

1. **Power Failure 1:** Detected voltage failure for digital circuit. (Connected to IC801 pin 1.)
2. **Power Failure 2:** Detected voltage failure for analog circuit. (Connected to IC801 pin 16.)

(Normal: High; Failure: Low)

Note: If power failure is detected 3 times in 15 minutes, the set will enter the standby mode and cannot be switched On. To reset the operating programs of the CPU it is necessary to disconnect the AC cord or AC adapter for a short time.

History of Power Failure

When finishing the repair or stopping the Power Failure, the history of past failures can be checked.

To see the history

1. Enter the service mode. See "Service Adjustments" page 3.
2. Select **Item No. 0D0** POWER ERR from the Service Adjustment Data Table.

History of Power Failures (Item No. 0C9)

Failure Name	Data
No Failure	00h(0)
Power Failure 1	01h(1)
Power Failure 2	02h(2)

Note: If simultaneous failures have been detected, the sum of each data is displayed.

For example:

Power failures 1 & 2

01h + 02h = **03h(3)**

Attention:

After finishing service, reset the data of **Item No. 0D0** with the + or – keys to **"00h(0)."**

SCHEMATIC DIAGRAMS

NOTES ON SCHEMATIC DIAGRAMS

1. All resistance values in ohms K=1,000 M=1,000,000.
2. Unless otherwise noted on schematic, all capacitor values less than 1 are expressed in μF (Micro Farad), and the values more than 1 are in pF.
3. Unless otherwise noted on schematic, voltage reading taken with VOM from point indicated to chassis ground. Voltage reading taken using color-bar signal VHF channel 5, all controls at normal. Line voltage at 120 volts. Some voltages may vary with signal strength.
4. Waveforms were taken with color-bar signal and controls set for normal picture. Waveforms marked with an * may vary with signal strength.
5. The Symbol  indicates a fusible resistor, which protects the circuit from possible short circuits.

SERVICE NOTES:

1. When replacing parts on circuit boards, clamp the lead wires to terminals before soldering.

PRODUCT SAFETY NOTICE

THE COMPONENTS DESIGNATED BY A STAR (★) ON THIS SCHEMATIC DIAGRAM DESIGNATE COMPONENTS WHOSE VALUES ARE OF SPECIAL SIGNIFICANCE TO PRODUCT SAFETY. SHOULD ANY COMPONENT DESIGNATED BY A STAR NEED TO BE REPLACED, USE ONLY THE PART DESIGNATED IN THE PARTS LIST. DO NOT DEVIATE FROM THE RESISTANCE, WATTAGE AND VOLTAGE RATINGS SHOWN.
